
GOING VIRAL

Kevin Flanagan – Head of Fixed Income Strategy
02/04/2020

This year has gotten off to an unusual start in the financial markets. Typically, the focus would be on the [Federal Reserve \(Fed\)](#) and/or economic developments, but unfortunately the coronavirus has taken center stage. I thought it would be useful to offer some insights from a bond market perspective, using the SARS outbreak of November 2002 to July 2003 as a comparative event.

I'm certainly not the only one doing such an analysis, but what I found is that the SARS episode did not occur in a vacuum. The current coronavirus and attendant risk-off trade is, without a doubt, the key driver of recent developments in the fixed income arena, especially for [Treasuries \(UST\)](#). However, after digging deeper (and being active in the markets at the time), the SARS episode was not necessarily the primary force driving rate trends 17 years ago. At that time, investors were still coping with the aftermath of the 9/11 attacks and anthrax scares of late 2001, as well as the corporate governance scandal (remember Enron and WorldCom). From a macro perspective, the U.S. was just coming out of the 2001 recession and the Fed was in the middle of an aggressive [rate cutting](#) cycle, taking [Fed Funds](#) from 6.50% ultimately down to 1.00% by June 2003.

Here are some key highlights and graphs from the Nov. 2002 thru Jul. 2003 period:

- The [UST 10-year yield](#) fell at one point by roughly 105 [basis points \(bps\)](#), but ended up being almost 25 bps higher than the yield level that was posted before the SARS news "hit the tape"
- The 3-month/10-year yield curve flattened at one point by roughly 75 bps, but finished 50 bps wider than the Nov. '02 reading
- The UST 2-year/10-year spread only narrowed by a little less than 15 bps, but was 55 bps wider come the end of Jul. '03
- U.S. real GDP fell to a low of +0.6% in Q4 2002 but snapped back to +7.0% in Q3 2003
- U.S. investment grade and high yield spreads were on a descending trajectory throughout, narrowing by 84 bps and 365 bps, respectively

U.S. Treasury 10-Year Yield

Treasury Curve Yields

Source: Bloomberg, as of 1/30/2020. Past performance is not indicative of future results.

Here are some key highlights for the current period:

- The UST 10-year yield has fallen about 30 bps since the coronavirus headlines began
- The UST 3-mo./10-yr curve has narrowed by a similar 30 bps, reflecting the aforementioned drop in the 10-year yield, and is now inverted again at -2 bps
- The UST 2-yr/10-yr curve has flattened 6 bps to +19 bps
- IG spreads have increased a modest 5 bps while HY spreads have widened more than 65 bps

Conclusion

To be sure, China’s economy is far more of a global influence in 2020 than it was 17 years ago. There is no doubt this outbreak will negatively impact Chinese GDP and, by extension, global growth. Estimates seem to be centered around a drag of around 0.5–1.0 pp for China, and 0.2–0.3 pp for the global outlook, assuming a peak is reached in Q1. While the U.S. is not insulated, the impact on real GDP is only expected to be a couple of percentage points at this time. Indeed, U.S. total trade with China as a percent of GDP is in the low single digits.

Once the coronavirus does peak, we would anticipate history repeating itself in the UST market with the 10-year yield moving back closer to 2% and the aforementioned yield curves re-steepening, and in the case of the 3-mo/10-yr curve, going back into positive territory. HY spreads could also experience some narrowing from the levels as of this writing.

Any economic drags now will more than likely be reversed, and then some, in subsequent quarters. In terms of the Fed, the January FOMC meeting underscored policy being in a

holding pattern, despite Fed Funds Futures pricing in two rate cuts this year.
